ABSTRACT

A method for transmitting prepaid charging/credit information to a mobile station. The available credit information can be sent to the mobile station by detecting a termination of a call chargeable to the subscriber of the mobile station; and in response to the detecting, sending the credit information to the mobile station as a connectionless message, preferably as a short message or a USSD message. Optionally, resources allocated to the call are released with sufficient delay for sending the connectionless message without paging the mobile station separately.
